11 LIVE DEPLOYMENTS · OPEN TO OPPORTUNITIES

I build things that actually run.

Final-year Computer Engineering student at **MIT World Peace University, Pune**. This page is a live portfolio — **every project below is deployed and clickable**, not a screenshot in a slide deck. Full-stack apps, AI/ML systems and real-data engineering pipelines, 22 repositories strong.

How I work

Patterns that show up across all of these repositories.

Tested, not just written

CI workflows with property-based and differential tests. The GPU test framework repo ships 133 passing cases and 4 planted bugs that every naive `allclose` test misses.

Real data, stated limits

CISA KEV, FIRST EPSS and openFDA are live public sources — and each README documents exactly what the analysis cannot claim. Facts separated from inference.

Idempotent by default

ETL runs are safe to re-run: business keys stay unique, failed rows are quarantined not dropped, and source-to-target totals reconcile on every load.

Deployed, not demoed

Every project here has a public URL. Static builds, hash routing and relative asset paths so nothing 404s when it leaves localhost.

Research output

Co-author on *“Security of LLM-Based AI Agents against Indirect Prompt Injection”* — a four-layer defence pipeline for resume screening, with a 60-PDF synthetic benchmark and ablation suite.

From-scratch systems

GPU particle physics engine (PBD/PBF, C++17 + CUDA behind one C ABI), batched MPPI motion planning for robot fleets, and GPU health drift detection — no frameworks.

Looking for someone who ships?

I'm open to full-stack, data engineering and AI engineering roles or internships. Happy to walk through any project's architecture, trade-offs or the parts that broke first.
